Finally, more than 1.5 years after the previous release, AVRDUDE 5.11 is finally done. This offers a nice compromise between readability and efficiency as well as working on all platforms. To program AVR's in Mac OS X, you will need the free `avr-gcc` compiler, `avr-libc`, AVRDUDE, and other associated tools. This is mostly a bugfix release, but also includes a few enhancements. The two most important enhancements are:

This is a write up of things to install and configure to get the tool chain up and running. [Avrduide Linux/Avrduide For Mac OS X/Avrduide Documentation](#) recently switched from Windows to OS X.

avrduide

`avrduide`, `avrduide_arduino`, `avrduideless`, `avrduide_gui`, `avrduide_ubuntu`, `avrduide_stk500v2_receivemessage()` `timeout`, `avrduide_stk500_getsync()`, `avrduide_programmer_is_not_responding`, `avrduide_windows`, `avrduide_linux`, `avrduide_prog`

Prerequisites

avrduide_stk500v2_receivemessage() timeout

Download the `CrossPack` for AVR Development, which is packaged as a `dmg` file. Open the

avrduide_arduino

[ATtiny45/9/10 programming support for bithang](#) I'm trying to program an ATmega644A. I bought a MacBook and I already love it. AVRDUDE 5.11 released posted by joergwarsch, Sat 27 Aug 2011 09:38:34 PM UTC - 0 replies. If you have a programmer or part that AVRDUDE does not know about, you can add it to the config file (be sure and submit a patch back to the author so that it can be incorporated for the next version). Use the specified config file for configuration data. This file contains all programmer and part definitions that AVRDUDE knows about. It works fine from Linux, but when I try the same project with the same programmer, an Olimex AVR ISP mkII, I get the following error: `avrduide -p ATmega644 -c .dmg` file, and double-click on `CrossPack-AVR.pkg`. Use Atmel's official IDE Atmel Studio, but it is only available on Windows, not Linux or Mac; Create program in your favorite C or text editor then compile and flash using `avr-gcc` and `avrduide`. I will detail the fourth and final option. The downside is, that I have to build up the complete environment to program AVR microcontrollers again. [e10c4156f](#)
